1. Project Overview

This project contains three beginner-friendly webpages created for the Web Development Activity-Based Learning assignment. They demonstrate HTML page structure, navigation, form controls, and CSS styling. Each webpage keeps its HTML and CSS together in one file. The pages use no JavaScript.

Project Objectives

- Practice creating a complete HTML document.
- Use CSS to style text, backgrounds, spacing, cards, and layouts.
- Create navigation links that move to sections within a page.
- Use common form controls such as text inputs, dropdowns, checkboxes, and radio buttons.
- Understand basic responsive design and front-end limitations.

2. Technologies Used

- HTML5 for page structure and content.
- CSS3 for colours, spacing, layouts, borders, and responsive styling.
- A modern web browser to open and test the webpages.

3. Webpage One: Personal Portfolio Website

File: experiment-4.html

Purpose: To present a student's profile and learning progress in a single-page portfolio.

Main sections

- Hero/introduction area with the student's name and role.
- About Me introduction.
- Skills displayed as individual boxes.
- Education details for B.Tech and Intermediate.
- Project cards for sample projects.
- Contact section with example contact information.

HTML Concepts

- Headings and paragraphs for content hierarchy.
- Anchor links in the navigation menu.
- Div containers to group related content.

CSS concepts

- Navigation bar and hero-section styling.
- Background colours and typography.
- Padding, margins, inline-block cards, rounded corners, and box shadows.

Testing notes: Click About, Skills, Education, Projects, and Contact. Confirm that each link moves to the matching section.

Replace sample contact details and verify all personal information before publishing.

4. Webpage Two: Student Registration Form

File: studentregistration.html

Purpose: To demonstrate a student registration interface with personal and academic fields.

Form fields

- First name and last name.
- Email and password.

- Mobile number and date of birth.
- Gender radio buttons.
- Branch dropdown.
- HTML skill checkbox.

HTML concepts

- form, fieldset, and legend elements.
- Labels and input controls.
- Text, password, telephone, date, radio, checkbox, and select elements.

CSS concepts

- Attribute selectors for different input types.
- Input dimensions and left spacing.

Important limitation: The form is a front-end demonstration. It does not validate every field, store information, or submit data to a database. Avoid entering real passwords or sensitive personal information into demonstration forms.

5. Webpage Three: Campus Food Corner

File: experiment8.html

Purpose: To present a sample campus food-corner website with menu information and a reservation interface.

Main sections

- Navigation links for About, Menu, Gallery, Reserve, and Contact.
- About section explaining the food corner.
- Menu cards with food names, descriptions, and prices.
- Snack list and ordered instructions for placing an order.
- Student special-offer banner.
- Food gallery with images and alternative text.
- Table-reservation form with name, email, guests, date, seating preference, and special requests.
- Contact information and footer.

HTML Concepts

- Anchor links, lists, images, sections, articles, and footer.
- Form labels, text/email inputs, dropdowns, radio buttons, and textarea.

CSS concepts

- CSS Grid and Flexbox for cards and gallery layout.
- Media queries for smaller screens.
- Borders, shadows, hover effects, background colours, and text styling.

Important limitations: The reservation form does not create a real booking without a backend. The gallery and offer images use external image URLs and need an internet connection.

6. How to Open the Websites

- Save the three HTML files in the same project folder.
- Open the folder on your computer.
- Double-click an HTML file to open it in your default browser.
- Alternatively, right-click the file and choose a browser under Open with.
- Resize the browser window to inspect responsive layouts where media queries are provided.

7. Testing Checklist

- Each HTML file opens without a blank page.
- Headings, text, cards, and form controls are visible.
- Navigation links jump to the correct sections.
- Form fields accept typing or selection as expected.
- The Campus Food Corner images load when internet access is available.
- The Campus Food Corner layout changes at smaller screen widths.
- Example contact details and sample content are checked before sharing publicly.

8. Known Limitations and Future Improvements

- No JavaScript or backend processing is included.
- Registration and reservation forms do not save or transmit submissions.
- Add stronger form validation and clear required-field indicators if the assignment permits.
- Improve mobile spacing and test navigation on multiple browsers.
- Correct any spelling or markup issues discovered during browser testing.
- Use accurate personal details and working contact information before publishing.

9. Conclusion

The three webpages demonstrate introductory front-end development skills: structuring content with HTML, styling it with CSS, creating internal navigation, arranging information in cards, and building basic forms. They provide a foundation for future projects that may include form validation, backend storage, and more advanced responsive design.
